

GroomerII – Air traffic control

A specialist communications solutions provider needed a stable and reliable solution for routing critical calls to and from air traffic integrated command and control systems (ICCS).

Results

Using Aculab's GroomerII gateway, the service provider was able to:

- Win a major tender and successfully deliver a government project to enhance airfield traffic control
- Deliver a solution that met stringent public sector requirements
- Cost-effectively deliver a solution to enable interconnection of its otherwise incompatible network hardware
- Put itself in a good position to win future, roll-out expansion business

Solution

GroomerII was enhanced with the implementation of a new routing configuration, based on translating provisioned ISDN destination sub-addresses, to select the appropriate CAS trunk connected to the airfield traffic control (ATC) system.
