

GroomerII – Pre-paid solution

LYCATEL, a UK-based prepaid calling card provider, needed a solution to enable incoming ISDN calls to be routed to multiple, independent SIP applications.

Results

Using Aculab's GroomerII gateway, LYCATEL was able to:

- Successfully launch its updated prepaid solutions offering
- Cost-effectively deliver call services to its expanding customer base
- Maximise return on investment from its IP-based, SIP-centric services delivery platform
- Benefit from Aculab's willingness and fleetness of foot in implementing a critical change

Solution

Aculab's development team implemented additional functionality in GroomerII to enable unique routing configurations to be applied, using wildcard parameters in the translation of DDI numbers to IP addresses. As a result, all calls are routed to the correct, SIP-based platform, based on a unique DDI number range being allocated to each individual application.
